---

## Classification

**Family:** Procyclolitidae Vaughan and Wells, 1943: 114

## Type Species

*Alpinoseris dendroidea* Roniewicz, 1989: 91, pl. 27, fig.1a-h by Monotypy in Roniewicz, 1989: 90.

**Holotype:** GBA 1982/12/806 (Dry Preserved: Verified).

**Type Locality:** Schneckengraben, Gosaukamm, Northern Calcareous Alps. Zlambach Beds, Rhaetian, LateTriassic

## Diagnosis

Thamnasterioid, frondose; calices on one side of the branch; branches from monocalicular to composed of irregular series of corallites; septes-of valleys present; calicular pits empty; menianes long, oriented upwards; dissepiments small; wall epithecal.

## Description

Described by Roniewicz 1989 based on the holotype of the type species (coll. number above)). Possibly, the same species was described by Zankl 1969: 32, text-fig. 24 under the name of *Procyclolites* sp.1.

## Comparisons

From *Alpinophyllia* Roniewicz and *Stuoresimorpha* Roniewicz differs in thamnasterioid type of colony and thin septa with long menianes with margins directed upwards.

## Remarks

Only the type species is known

## Distribution

Southern Europe; Late Triassic

**Remarks:** Known from the Rhaetian, Northern Calcareous Alps, Austria
